How will China's solar policy change in Q4 2025?

Starting in Q4 2025, China will scrap its 13% VAT export rebate on solar modules and storage systems. This fiscal change will ripple through global pricing since China supplies over 80% of the world's solar modules and 90% of lithium iron phosphate (LFP) battery packs. That policy shift means developers worldwide will face higher costs.

Why are solar & energy storage costs rising in Q4 2025?

Equipment procurement costs for solar and energy storage will jump around 9% starting in Q4 2025, marking the end of the bargain pricing developers have enjoyed for the last 18 months. That's because China is changing the rules. Wood Mackenzie points to three major drivers behind the coming spike: Polysilicon consolidation.

How will China's Export tax rebate affect the solar industry?

The end of China's export tax rebate. Starting in Q4 2025, China will scrap its 13% VAT export rebate on solar modules and storage systems. This fiscal change will ripple through global pricing since China supplies over 80% of the world's solar modules and 90% of lithium iron phosphate (LFP) battery packs.

How will China's energy storage policy affect global demand?

"China was on-track to install over 60% of all utility scale storage globally in 2025 and so in the absence of further policy changes, about 45% of global demand has just been wiped away," Hilton says. The ripple effect on the global demand-supply balance will involve further downward pressure on energy storage prices.

Ever wondered why your neighbor's new solar setup cost half what yours did two years ago? Welcome to China's energy storage revolution, where prices are dropping faster ...

In a major policy shift towards electricity market liberalization, China has introduced contract for difference
