What is a s8050 transistor?

The transistor operates efficiently at frequencies up to several tens of megahertz, supported by a low saturation voltage that reduces power loss in switching circuits. Packaged in the TO92 form factor, the S8050 is compact, thermally stable, easy to integrate on crowded PCBs.

What is the difference between a s8050 & s8550?

“Complementary” means that we need an NPN transistor and its equivalent PNP transistor. In this case, the NPN transistor is the S8050, and its equivalent PNP transistor is the S8550. A simple circuit diagram of a Class B amplifier using the S8050 is shown below.

What is s8050 transistor (NPN)?

S8050 TRANSISTOR (NPN) SOT-23 SOT-23 SOT-23 Plastic-Encapsulate Transistors Features S8550 ; Complementary to S8550 300mW; Power Dissipation of 300mW High Stability and High Reliability Mechanical Data SOT-23 SOT-23 Small Outline Plastic Package ... How many Ma should a s8050 transistor have?

To ensure safe operation, the base current should be limited to 5 mA. As an NPN transistor, the S8050 has three terminals: emitter, base, and collector, which are used for external connections in various circuits. The doping concentration of these terminals differs, with the emitter being heavily doped compared to the collector and base.
