How do I calculate the voltage drop over wires given a supply voltage and a current? How do I anticipate on voltage drop so that the final load has the correct supply voltage? What will be ...

2 Line to line voltage for a 3phase network (120deg separation) is  $\sqrt{3}$ \*phase voltage. So for a 230V 3ph network the line-line is 400V

Yes, because  $I$  is a function of  $V$ , as long as we're talking about resistors. Power is linearly proportional to voltage, though, if you're talking about a constant current device.

Voltage has exactly the same problem: one terminal can only "have a voltage" when compared to another terminal. Voltage acts like distance: voltage and distance are double ...

A current source can certainly have a voltage across it. If the voltage across a current source is zero, then it is not delivering or absorbing any power. However, if the voltage ...

6 It's not the voltage but the current that kills, is a popular yet still incorrect incomplete answer. It is the ENERGY that kills. With static electricity you will be exposed to voltages much, ...

An intuitive way to look at is that all the voltage is dropped across two resistors, and since the resistors are the same, the voltage drop across each will be the same, each taking half.

The reverse voltage is the voltage drop across the diode if the voltage at the cathode is more positive than the voltage at the anode (if you connect + to the cathode). This ...

Voltage instead "regulates" how fast a motor can run: the maximum speed a motor can reach is the

speed at which the motor generates a voltage (named &quot;Counter-electromotive ...

Voltage of &quot;local ground&quot; The absolute charge on local ground is not actually a thing. Voltage is only ever defined as a difference between two points, so there is no such ...
